Binary Search

Find the ***boundary of 0-1*** in a ***0-1 monotone sequence fast***.

Two Typical Scenarios

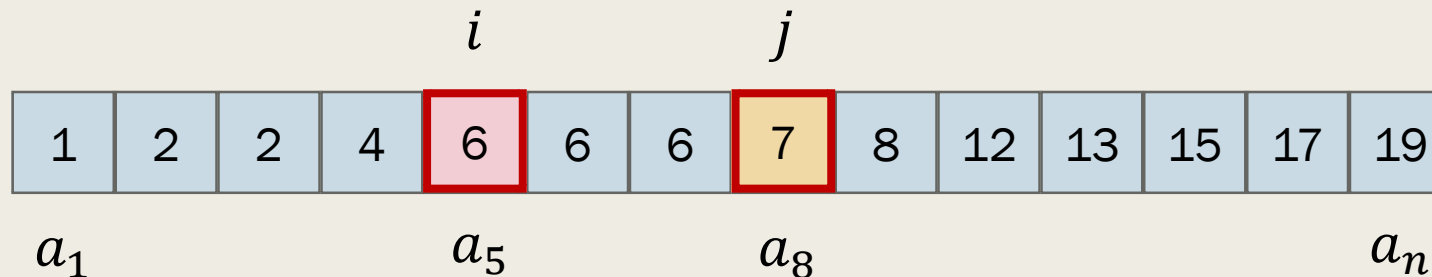

- Given a sequence of numbers a_1, a_2, \dots, a_n that are **sorted** in non-descending order.

For a given value k ,

- Find the smallest index i such that $a_i \nless k$.
- Find the smallest index j such that $a_j > k$.

the first element $\geq k$.

the first element $> k$.

For $k = 6$,

$$i = 5$$

$$j = 8.$$

Two Typical Scenarios

- Given a sequence of numbers a_1, a_2, \dots, a_n that are in non-descending order.

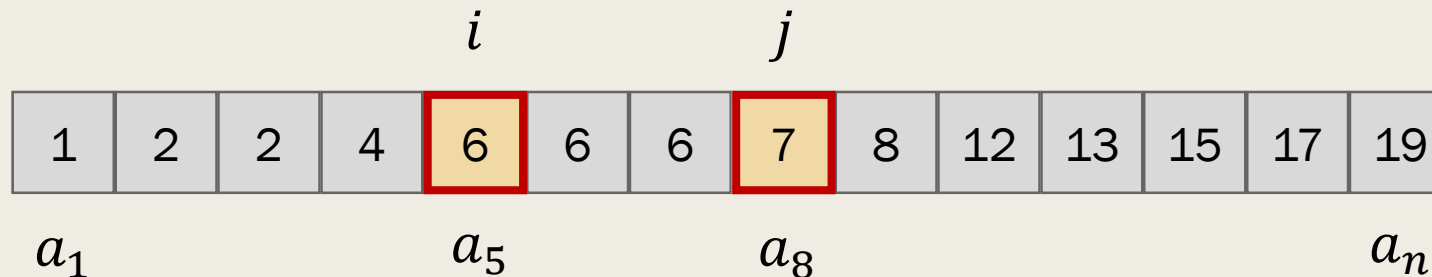

For a given value k ,

- Find the smallest index i such that $a_i \nless k$.
- Find the smallest index j such that $a_j > k$.

$j - i$ is the number of times k appears.

the first element $\geq k$.

the first element $> k$.

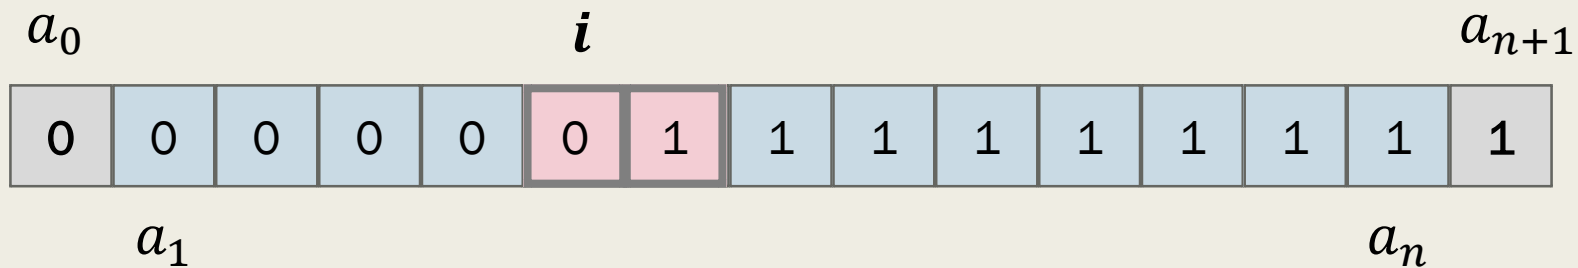

For $k = 6$,

$i = 5$

$j = 8$.

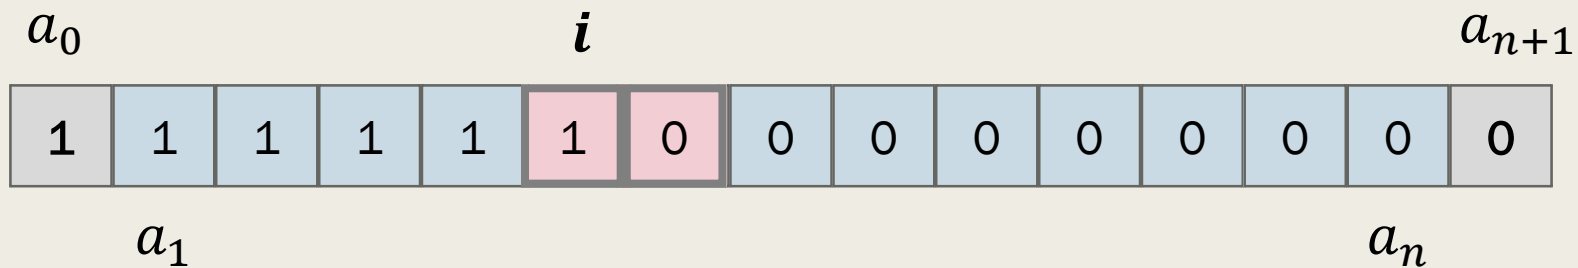

The General Scenario

- Given a 0-1 sequence a_1, a_2, \dots, a_n sorted in order, further assume that $a_0 = 0$ and $a_{n+1} = 1$.
 - Find the index i such that $a_i \neq a_{i+1}$, i.e., identify the boundary of 0 and 1.

Alternative (Equivalent) Scenario

- Given a 0-1 sequence a_1, a_2, \dots, a_n sorted in order,
further assume that $a_0 = 0$ and $a_{n+1} = 1$.
 - Find the index i such that $a_i \neq a_{i+1}$,
i.e., identify the boundary of 1 and 0.

Converting to the General Scenario

- The first search problem can be converted to the general form.

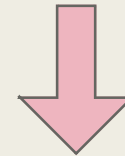

- Find the smallest index j such that $a_j > k$.

For $k = 6$,

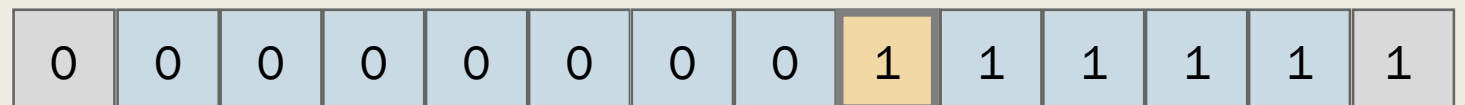

For each element a_i , we ask

- Is $a_i > k$?

the first element that is 1.

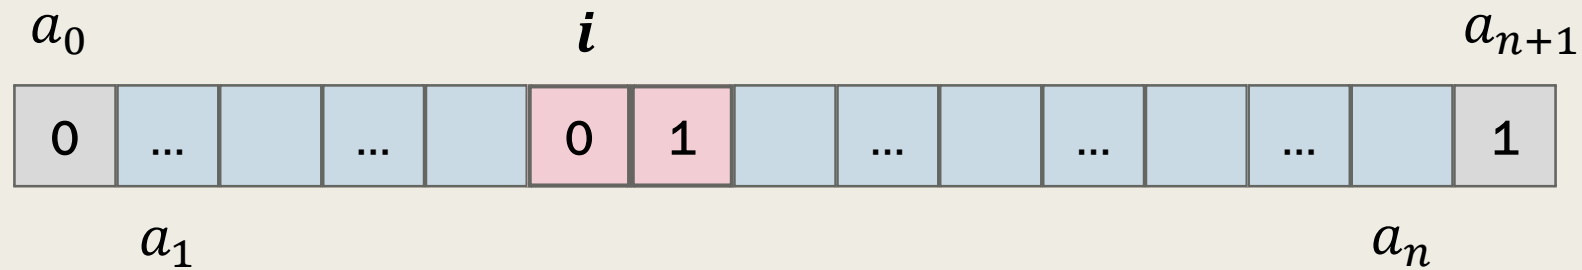

Binary Search on 0-1 Sequence

Find the **boundary of 0-1** in a **0-1 monotone sequence fast**.

Problem Scenario

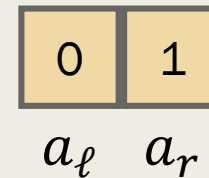

- Let a_1, a_2, \dots, a_n be a 0-1 sequence of interests.
 - We further assume that $a_0 = 0$ and $a_{n+1} = 1$.
 - Find the index $i \in \{0, 1, \dots, n\}$ such that $a_i = 0$ and $a_{i+1} = 1$.

Let a_1, a_2, \dots, a_n be a 0-1 sequence. Assume that $a_0 = 0$ and $a_{n+1} = 1$.

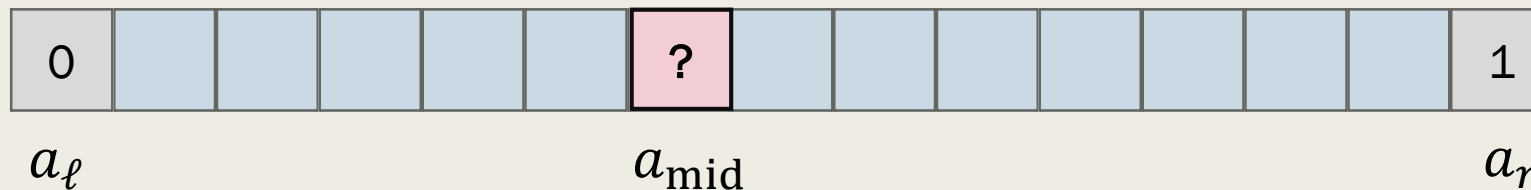

- Given two indexes $\ell < r$ with $a_\ell = 0$ and $a_r = 1$, find the index $i \in [\ell, r - 1]$ such that $a_i = 0$ and $a_{i+1} = 1$.

- If $r - \ell$ is 1, then we're done.

- Otherwise, $r - \ell > 1$.

Take $\text{mid} := \lfloor (\ell + r)/2 \rfloor$ and inspect a_{mid} .

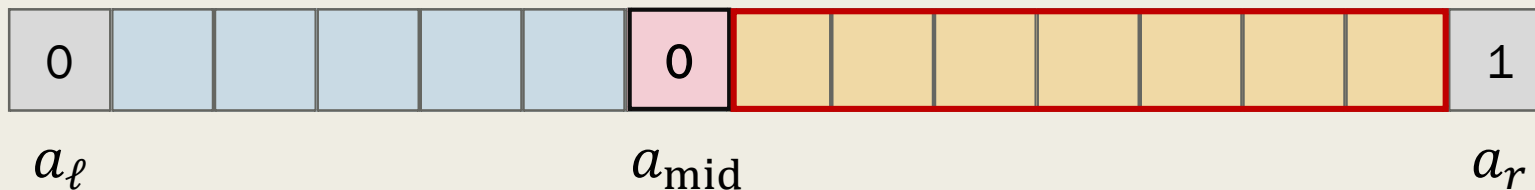

Let a_1, a_2, \dots, a_n be a 0-1 sequence. Assume that $a_0 = 0$ and $a_{n+1} = 1$.

- Given two indexes $\ell < r$ with $a_\ell = 0$ and $a_r = 1$, find the index $i \in [\ell, r - 1]$ such that $a_i = 0$ and $a_{i+1} = 1$.

- Take $\text{mid} := \lfloor (\ell + r)/2 \rfloor$ and inspect a_{mid} .

- If $a_{\text{mid}} = 0$, then the answer is in the right-hand-side.

We have a **recursive problem** on (mid, r) .

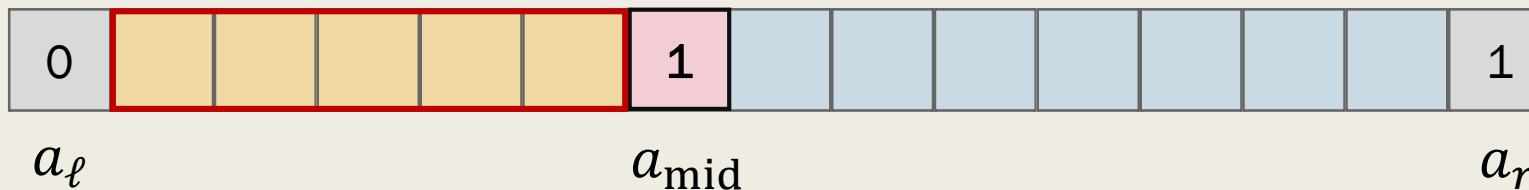

Let a_1, a_2, \dots, a_n be a 0-1 sequence. Assume that $a_0 = 0$ and $a_{n+1} = 1$.

- Given two indexes $\ell < r$ with $a_\ell = 0$ and $a_r = 1$, find the index $i \in [\ell, r - 1]$ such that $a_i = 0$ and $a_{i+1} = 1$.

- Take $\text{mid} := \lfloor (\ell + r)/2 \rfloor$ and inspect a_{mid} .

- If $a_{\text{mid}} = 1$, then the answer is in the left-hand-side.

We have a **recursive problem** on (ℓ, mid) .

- BinarySearch(L, R) - To search the 0-1 sequence a_L, \dots, a_R
-

A. $\ell \leftarrow L - 1.$

$r \leftarrow R + 1.$

B. While $r - \ell > 1$, do the following.

a) $\text{mid} \leftarrow \lfloor (\ell + r)/2 \rfloor.$

b) If a_{mid} is 0, set $\ell \leftarrow \text{mid}.$

Otherwise, set $r \leftarrow \text{mid}.$

C. Report $(\ell, r).$

Correctness of Binary Search

- In step (Ba),
we always have $L \leq \text{mid} \leq R$.

- When $\ell < r - 1$, we have

$$\ell < \lfloor (\ell + r)/2 \rfloor < r .$$

- The answer to be searched is always contained within $[\ell, r]$
in the beginning of the while loop in step (B).

Time Complexity

- The running time of this algorithm can be described by the following recurrence.

$$T(n) = \begin{cases} \Theta(1), & n \leq 2, \\ T(\lfloor n/2 \rfloor) + \Theta(1), & n > 3. \end{cases}$$

- Solving the recurrence, we obtain $T(n) = \Theta(\log n)$.

- LowerBound($A[1 \dots n], k$) - $A[1 \dots n]$ sorted in non-descending order.
Find the smallest i such that $A[i] \geq k$
-

A. $\ell \leftarrow 0$.

$r \leftarrow n + 1$.

B. While $r - \ell > 1$, do the following.

a) $\text{mid} \leftarrow \lfloor (\ell + r) / 2 \rfloor$.

b) If $a_{\text{mid}} < k$, set $\ell \leftarrow \text{mid}$.

Otherwise, set $r \leftarrow \text{mid}$.

C. If r equals $n + 1$, then report “No such element”.

Otherwise, report r .

- UpperBound($A[1 \dots n], k$) - $A[1 \dots n]$ sorted in non-descending order.
Find the smallest i such that $A[i] > k$
-

A. $\ell \leftarrow 0$.

$r \leftarrow n + 1$.

B. While $r - \ell > 1$, do the following.

a) $\text{mid} \leftarrow \lfloor (\ell + r) / 2 \rfloor$.

b) If $k < a_{\text{mid}}$, set $r \leftarrow \text{mid}$.

Otherwise, set $\ell \leftarrow \text{mid}$.

C. If r equals $n + 1$, then report “No such element”.

Otherwise, report r .

本週程式題導覽

Problem - A

- 讀入一群在資料庫裡的數字，
判斷接下來讀入的數字是否在資料庫裡。
 - 本題基本上有兩種不同的作法。
 - 先排序資料庫裡的數字，再使用 binary search 進行搜尋
 - 使用 C++ 關聯容器儲存資料，並使用其成員函式進行搜尋
 - 建議同學可練習以不同的方法完成本題

Problem - B

■ Tangent Point Query.

給定第一象限內的一個 upper convex curve,
以及在第二象限的一連串 query points.

計算每個 query point 在 upper convex hull 上的切點.
